Lab 11：Project-3

张献伟、吴坎

xianweiz.github.io

DCS292, 4/28/2022

Project 3: What?

- 文档描述： https://github.com/arcsysu/SYsU-lang/tree/main/generator
- 实现一个IR生成器
  - 输入：抽象语法树（由Project 2或Clang提供）
  - 输出： LLVM-IR
- 总体流程
  - 引入Project2的parser（或使用clang）
  - 遍历得到的AST
 - 对各Function和Statement等生成IR代码

- 截止时间
  - **5/26/2022**

Project 3: How?

- 实现
  - $vim generator/generator.cc
- 编译
  - $cmake --build ~/sysu/build -t install
    - 输出：~/sysu/build/generator
- 运行
  - (export PATH=~/sysu/bin:$PATH \
    CPATH=~/sysu/include:$CPATH \
    LIBRARY_PATH=~/sysu/lib:$LIBRARY_PATH \
    LD_LIBRARY_PATH=~/sysu/lib:$LD_LIBRARY_PATH && clang -E
    tester/functional/000_main.sysu.c | <THE_PARSER> | sysu-
    generator)
    - Clang提供AST：<THE_PARSER> = clang -cc1 -ast-dump=json
    - Project2提供AST： <THE_ PARSER > = sysu-parser

Where we are NOW?

https://github.com/arcsysu/SYsU-lang
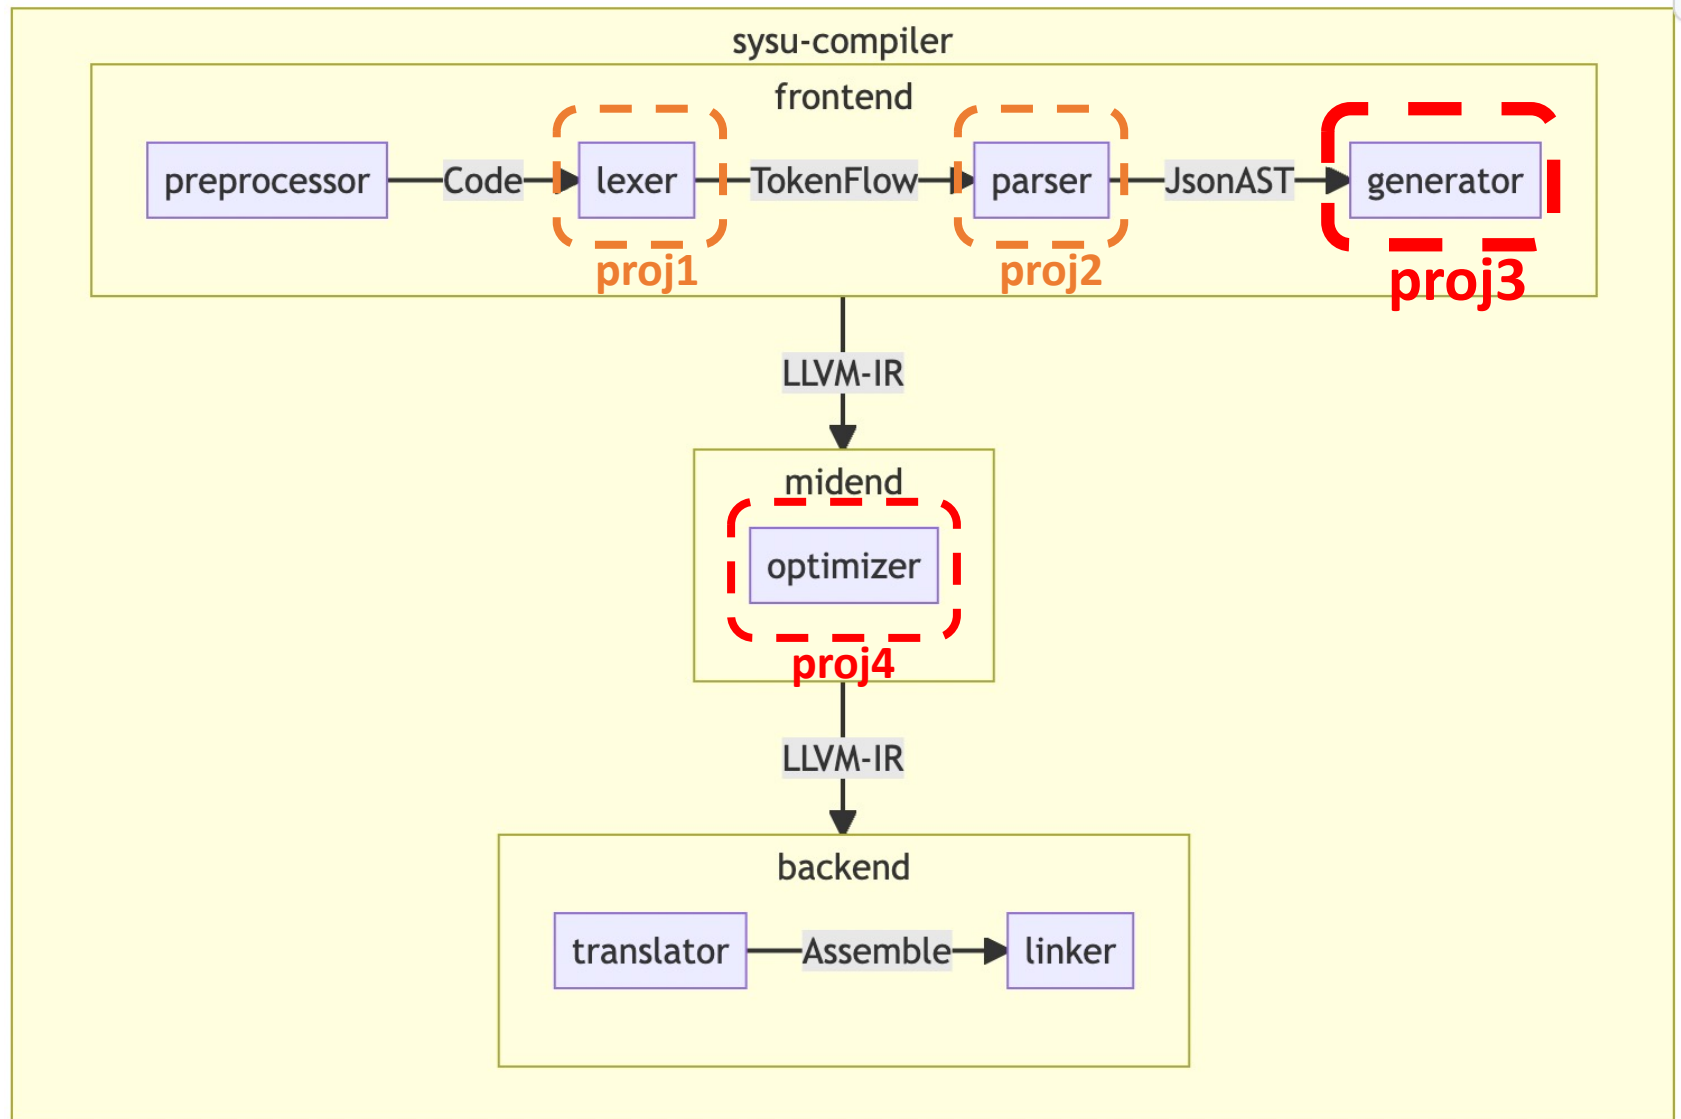

CodeGen[中间代码生成]
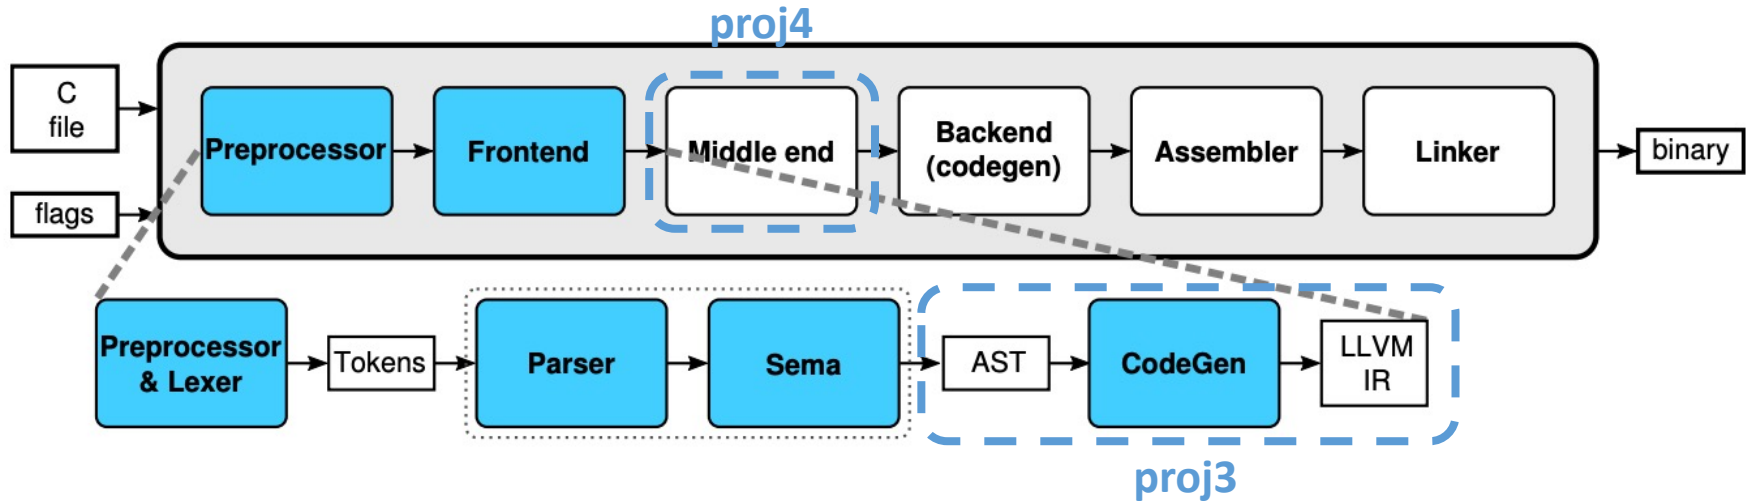

- Not to be confused with LLVM CodeGen! (which generates machine code)

- Uses AST visitors, IRBuilder, and TargetInfo
    - AST visitors
        - RecursiveASTVisitor for visiting the full AST
        - StmtVisitor for visiting Stmt and Expr
        - TypeVisitor for Type hierarchy

AST ➔ IR: Example

$clang -Xclang -ast-dump -fsyntax-only ../tester/functional/000_main.sysu.c

```
TranslationUnitDecl 0x1d2654a8 <<invalid sloc>> <invalid sloc>
           ... cutting out internal declarations of clang ...
`-FunctionDecl 0x2cf71448 <../tester/functional/000_main.sysu.c:1:1, line:3:1> line:1:5 main 'int ()'
  `-CompoundStmt 0x2cf71560 <col:11, line:3:1>
    `-ReturnStmt 0x2cf71550 <line:2:5, col:12>
      `-IntegerLiteral 0x2cf71530 <col:12> 'int' 3
```

$clang -emit-llvm -S ../tester/functional/000_main.sysu.c

```
; ModuleID = '../tester/functional/000_main.sysu.c'       注释
source_filename = "../tester/functional/000_main.sysu.c"        源文件名
target datalayout = "e-m:e-i8:8:32-i16:16:32-i64:64-i128:128-n32:64-S128"        目标平台：数据布局[1]
target triple = "aarch64-unknown-linux-gnu"
                                                     目标平台：arch-vendor-os

; Function Attrs: noinline nounwin        函数定义：define <返回类型> @<函数名>（参数）#属性[2]
define dso_local i32 @main() #0 {
  %1 = alloca i32, align 4          临时寄存器/变量：分配栈空间，地址存入%1，大小同i32类型，4B对齐
  store i32 0, i32* %1, align 4
                                     数据写入内存：将0写入%1对应的内存中，4B对齐
  ret i32 3          函数返回
}

[3] LLVM之IR 篇（1）：零基础快速入门 LLVM IR

AST ➔ IR: Example (cont.)

Source

```
1 int main(){
2     return 3;
3 }
```

AST

```
TranslationUnitDecl 0x1d2654a8 <<invalid sloc>> <invalid sloc>
            ... cutting out internal declarations of clang ...
`-FunctionDecl 0x2cf71448 <../tester/functional/000_main.sysu.c:1:1, line:3:1> line:1:5 main 'int ()'
  `-CompoundStmt 0x2cf71560 <col:11, line:3:1>
    `-ReturnStmt 0x2cf71550 <line:2:5, col:12>
      `-IntegerLiteral 0x2cf71530 <col:12> 'int' 3
```

IR

```
define i32 @main() {
  %1 = alloca i32
  store i32 0, i32* %1
  ret i32 3
}
```

```
define i32 @main() {
  ret i32 3
}
```

LLVM IR[中间代码]

- **Three different forms (these three forms are equivalent)**
  - in-memory compiler IR[在内存中的编译中间语言]
  - on-disk bitcode file[.bc, 在硬盘上存储的二进制中间语言]
  - human readable text asembly language file[.ll, 人类可读的代码语言]

- **LLVM IR is machine independent[机器无关]**
  - An unlimited set of virtual registers (labelled %0, %1, %2, %3...)
    - It's the backend's job to map from virtual to physical registers
  - Rather than allocating specific sizes of datatypes, we retain types
    - Again, the backend will take this type info and map it to the size of the datatype
  - We write LLVM IR in Static Single Assignment (SSA) form, making life easier for optimization writers[静态单赋值]
    - SSA just means we define variables before use and assign to variables only once

generator.cc

```cpp
void buildTranslationUnitDecl(const llvm::json::Object *O) {
  if (O == nullptr)
    return;
  if (auto kind = O->get("kind")->getAsString()) {
    assert(*kind == "TranslationUnitDecl");        根节点
  } else {
    assert(0);
  }

  if (auto inner = O->getArray("inner"))
    for (const auto &it : *inner)    遍历内部节点
      if (auto P = it.getAsObject())
        if (auto kind = P->get("kind")->getAsString()) {
          if (*kind == "FunctionDecl")
            buildFunctionDecl(P);    具体IR生成
        }
}
} // namespace

int main() {
  auto llvmin = llvm::MemoryBuffer::getFileOrSTDIN("-");    从文件或stdin获取AST文本
  auto json = llvm::json::parse(llvmin.get()->getBuffer());    解析为JSON格式
  buildTranslationUnitDecl(json->getAsObject());    遍历AST，生成IR
  TheModule.print(llvm::outs(), nullptr);    输出IR
}
```

https://github.com/arcsysu/SYsU-lang/blob/main/generator/generator.cc

generator.cc (cont.)

```cpp
llvm::LLVMContext TheContext;
llvm::Module TheModule("-", TheContext);

llvm::Function *buildFunctionDecl(const llvm::json::Object *O) {
  // First, check for an existing function from a previous declaration.
  auto TheName = O->get("name")->getAsString()->str();
  llvm::Function *TheFunction = TheModule.getFunction(TheName);

  if (!TheFunction)
    TheFunction = llvm::Function::Create(
        llvm::FunctionType::get(llvm::Type::getInt32Ty(TheContext), {}, false),
        llvm::Function::ExternalLinkage, TheName, &TheModule);

  if (!TheFunction)
    return nullptr;

  // Create a new basic block to start insertion into.
  auto BB = llvm::BasicBlock::Create(TheContext, "entry", TheFunction);
  llvm::IRBuilder<> Builder(BB);

  if (auto RetVal = llvm::ConstantInt::get(
          TheContext, /* i32 3(decimal) */ llvm::APInt(32, "3", 10))) {
    // Finish off the function.
    Builder.CreateRet(RetVal);

    // Validate the generated code, checking for consistency.
    llvm::verifyFunction(*TheFunction);

    return TheFunction;
  }

  // Error reading body, remove function.
  TheFunction->eraseFromParent();
  return nullptr;
}
```

用于保存全局的状态，在多线程执行的时候，可以每个线程一个LLVMContext，避免竞争

LLVM IR程序的顶层结构

创建一个函数，并指派给Module

参数：类型

参数：链接方式、函数名、该函数待插入的模块
"ExternalLinkage"表示该函数可能定义于当前模块之外，且/或可以被当前模块之外的函数调用。

int main()

为创建的Function添加Basic Block

使用IRBuilder插入指令到BB

return 3

返回值指令语句

https://releases.llvm.org/11.0.1/docs/tutorial/MyFirstLanguageFrontend/LangImpl03.html
https://llvm.org/docs/tutorial/MyFirstLanguageFrontend/LangImpl03.html

https://github.com/arcsysu/SYsU-lang/blob/main/generator/generator.cc

Variables in codegen[相关变量]

- **TheContext**: an opaque object that owns a lot of core LLVM data structures, such as the type and constant value tables

- **TheModule**: an LLVM construct that contains functions and global variables
  - In many ways, it is the top-level structure that the LLVM IR uses to contain code

- **Builder**: a helper object that makes it easy to generate LLVM instructions
  - Instances of the IRBuilder class template keep track of the current place to insert instructions and has methods to create new instructions
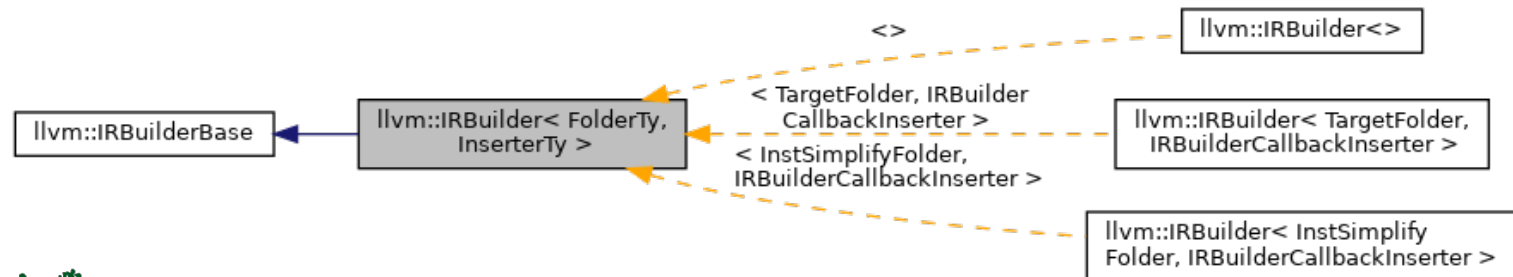

IR Overview

- Each assembly/bitcode file is a Module

- Each **Module** is comprised of
  - Global variables
  - A set of **Function**s which consists of
    - A set of **Basic Bloc**ks
      - Which is further comprised of a set of **Instruction**s
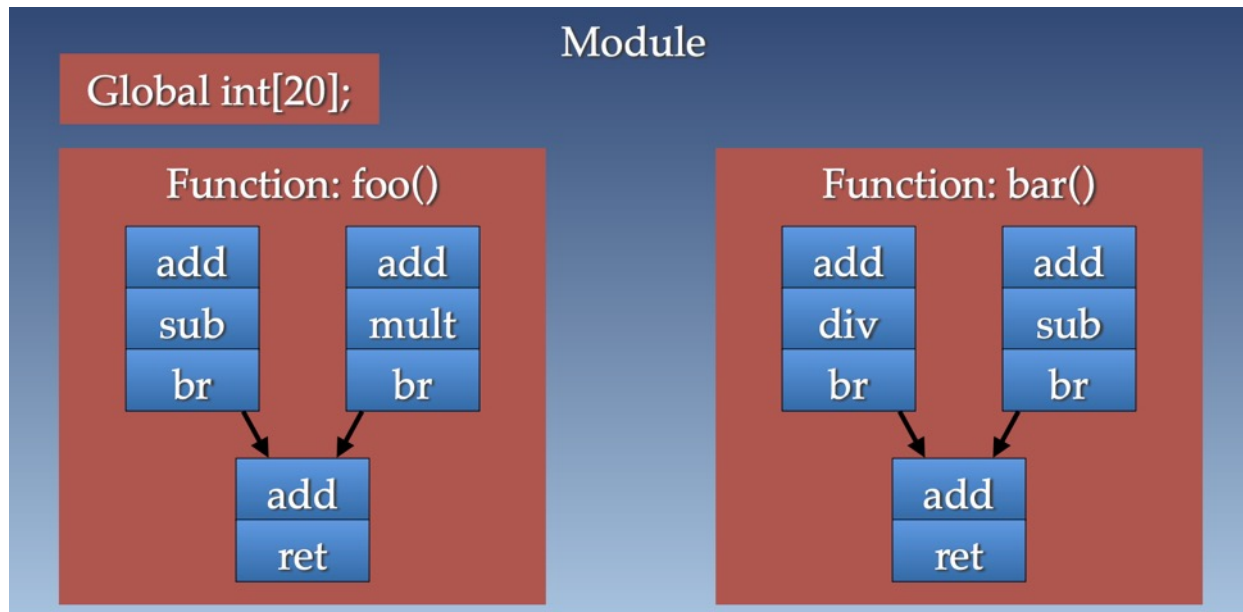

Visualize IR[可视化]

- $clang -emit-llvm -S ../tester/functional/027_if2.sysu.c

```
@a = dso_local global i32 0, align 4

define dso_local i32 @main() {
  %1 = alloca i32, align 4
  store i32 0, i32* %1, align 4
  store i32 10, i32* @a, align 4
  %2 = load i32, i32* @a, align 4
  %3 = icmp sgt i32 %2, 0
  br i1 %3, label %4, label %5

4:
  store i32 1, i32* %1, align 4
  br label %6

5:
  store i32 0, i32* %1, align 4
  br label %6

6:
  %7 = load i32, i32* %1, align 4
  ret i32 %7
}
```

$opt -dot-cfg 027_if2.sysu.ll [→ .main.dot]

```
